

# TBI-GEU Summer Internship Program 2026

Week 1 — BI Case Study Notes

Intern ID: 26101136 | AI-Enabled Business Intelligence | Herbal & Aromatics

## Case Study 1: Young Living Essential Oils — USA

|                              |                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Industry:</b>             | Essential Oil Production & Retail                                                                                                                                                                                                                                                 |
| <b>What BI was used for:</b> | Young Living implemented a BI system to track batch-level yield efficiency across its 14 global farms. The system aggregated harvest weight, distillation duration, temperature, and oil output per batch, then surfaced anomalies where yield dropped below expected thresholds. |
| <b>KPIs Tracked:</b>         | Yield efficiency (ml per kg of input), batch rejection rate, average distillation duration by crop variety, seasonal output variance.                                                                                                                                             |
| <b>Decision Informed:</b>    | The data identified that lavender harvested in early morning produced 18% higher yield than mid-afternoon harvests, leading to a revised harvest protocol that increased annual output without additional input cost.                                                             |
| <b>Source:</b>               | Young Living Farm & Sustainability Reports — <a href="https://youngliving.com/en_US/discover/sustainability">youngliving.com/en_US/discover/sustainability</a>                                                                                                                    |

## Case Study 2: Uttarakhand Medicinal Plant Board (UMPB) — India

|                              |                                                                                                                                                                                                                                                                                       |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Industry:</b>             | Government Agri-Herbal Supply Chain                                                                                                                                                                                                                                                   |
| <b>What BI was used for:</b> | UMPB used data collection and BI reporting to monitor herb cultivation area, production tonnage, and MSP (Minimum Support Price) compliance across registered farmers in districts like Chamoli, Pithoragarh, and Rudraprayag. Reports were generated quarterly for policy decisions. |
| <b>KPIs Tracked:</b>         | Cultivation area (hectares), production volume (tonnes/season), number of registered growers, MSP payment compliance rate, species-wise output trend.                                                                                                                                 |
| <b>Decision Informed:</b>    | Analysis revealed that Jatamansi and Kutki were being over-harvested relative to regeneration rates. This informed new zoning regulations and supported the AYUSH certification roadmap for sustainable sourcing.                                                                     |
| <b>Source:</b>               | Uttarakhand Medicinal Plant Board — <a href="https://ukherbalindia.org">ukherbalindia.org</a>                                                                                                                                                                                         |

## Case Study 3: doTERRA International — USA

|                              |                                                                                                                                                                                                                                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Industry:</b>             | Essential Oil Supply Chain & Quality BI                                                                                                                                                                                                                                                          |
| <b>What BI was used for:</b> | doTERRA built a co-impact sourcing BI dashboard that tracked supplier-level batch data from 45+ countries, including India's frankincense and vetiver suppliers. The platform gave sourcing teams real-time visibility into yield, purity scores, and co-impact payments to farming communities. |

|                           |                                                                                                                                                                                                           |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KPIs Tracked:</b>      | Purity score per batch (GC-MS analysis result), co-impact payment per kg, supplier yield consistency index, order fulfillment lead time, seasonal supply gap ratio.                                       |
| <b>Decision Informed:</b> | Dashboard insights showed a consistent yield drop in Indian vetiver during monsoon months, prompting doTERRA to pre-purchase and stockpile vetiver before the season — reducing supply disruption by 34%. |
